**Abstract:** A field experiment was conducted with linseed under Poplar during Rabi season of 2018 at crop Research Farm, Department of Silviculture & Agroforestry, SHUATS, Prayagraj, (U. P.). An approach to land use that incorporates trees into farming systems, and allows for the production of trees and crops or livestock from the same piece of land in order to obtain economic, ecological, environmental and cultural benefits. Fastgrowing energy plant and trees such as poplar are characterized by short-term growth and weight gain significantly exceeding the average growth of other plant during the growing period. Use of vermicompost for crop growth is in focus in recent researches, but the response to the application of vermicompost had been specific to each plant species and the stage of growth. Such as unbalance continuous application of limited fertilizers both in the amount and type may aggravate the depletion of other important nutrients such as K, Mg, Ca, S and micro-nutrients not supplied by the chemical fertilizer and may also lead to chemical soil degradation. The treatment comprised of FYM 100%, Control, VC 100%, FYM 50%, VC 50%, FYM 75%, VC 75%, FYM 125%, VC 125% under Poplar based Agroforestry. The experiment was laid out in Randomized Block Design (RBD). The result showed that maximum plant height (cm), plant diameter (cm²) recorded at 30, 60, 90 and 120 DAT, capsule per plant, seed per capsule were recorded. The treatment (T₁₁) with application of (FYM 125%) showed the significant superiority in giving the maximum plant height (58.41 cm at 120 days), plant diameter (4.43 cm² at 120 days), capsule per plant (48.93 at 120 days), and seed per capsule 9.33. Poplar based Agroforestry system could be rank based on economic performance of linseed also recorded in treatment T₁₁ (FYM 125%).

1. Introduction

The theme of Agroforestry centered on sustainability in terms of economics (productivity and profitability), ecology (environmental and resource conservation) and social issues (food security, health and safety) that make it an unparallel land use system [9].

Linseed (*Linum usitatissimum* L.) belongs to the order *Malpighiales*, the family *Linaceae*, and the tribe *Lineae*. It is the second most important Rabi oilseed crop and stands next to rapeseed-mustard in area of cultivation and seed production in India. The genus *Linum* is composed of approximately 230 species but cultivated linseed is the only species of economic importance in the genus and is one of the oldest plants cultivated for fibre and oil [13].

The flaxseed growing is in production of seed for food industry and technical purposes and fibre for textile industry. Other technical use of flax is about possible in the field of paper production [7].

Flaxseed is rich in oil (41%), protein (20%), dietary fiber (28%), contains 7.7% moisture and 3.3% ashes. It has a high percentage of essential fatty acids, 75% polyunsaturated fatty acids, 57% alpha-linolenic acid, which is an omega-3 fatty acid, and 16% linoleic acid, which is an omega-6 fatty acid [8].

Flaxseed is grown as either oil crop or a fiber crop with fiber linen derived from the stem of fiber varieties and oil from the seed of linseed varieties (Diederichsen *et al.*, 2003;
Vaisey-Genser et al., 2003).

The world area cultivated with flaxseed is 3016940 ha with an annual average seed yield of 852 kg ha\textsuperscript{-1}. Canada, India, China, and the USA are the main world producers. Canada and the USA have 93\% of the total exported volume (FAO, 2007). After extraction of fibre from stalk, the woody core of the stem and short fibres are used as raw pulp for making high grade paper. To increase the quality of the paper more than 20\% strong virgin wood fibre must be add to the pulp. This extra strong fibre which is to be adding to the pulp is called as pulp sweeteners. As flax fibres are stronger and longer than any other virgin wood fibre, a small quantity of flax fibre can be use in place of virgin wood fibres. This pulp can be utilized for the manufacture of paper used for currency notes, airmail, parchment paper, good writing paper, cigarette paper and straw boards of all grades of economic value [4].

Fast-growing energy plant and trees such as poplar are characterized by short term growth and weight gain significantly exceeding the average growth of other plant during the growing period [6]. Poplar is highly adaptable to the climate in Korea. It grows rapidly and has been widely utilized in timber production and landscaping. In addition, due to its high carbon absorption capacity, Poplar is the major tree species used in reforestation for the formation of bio-circulation forests in order to replace fossil fuels and secure Certified Emission Reductions [10, 11].

Poplar market price trend, which was lowest during 2003 and recovered back during 2005 and recently touched the maximum of Rs. 12,000/- ton, which has again attracted the attention of farmers. It is important to mention that the profitability of Poplar based Agroforestry is only accountable after the harvesting of poplar trees (5-8 yrs) [3].

Use of soil micro-organisms which can either fix atmospheric nitrogen, solubilize phosphate, synthesis of growth promoting substances or by enhancing the decomposition of plant residues to release vital nutrients and increase humid content of soils, will be environmentally begin approach for nutrient management and ecosystem function [15]. Farm yard manure is a decomposed mixture of cattle dung and urine with straw and litter used as bedding material and residues from the fodder fed to the cattle. The waste material of cattle shed consisting of dung and urine soaked in the refuses of the shade is collected daily and placed in trenches about 6-7m long, 1.5-2m broad and 1m deep. Each trench is filled up to a height of about 0.5m above the ground level. The top of the heap is to be made dome shaped and plastered over with cow dung earth slurry. It becomes ready to apply after 3-4 months. It is possible to prepare by this process 7-8.5m\textsuperscript{3} of manure. Well rotten farmyard manure contains 0.4-1.5\% N, 0.3-0.9\% P\textsubscript{2}O\textsubscript{5} and 0.3-1.9\% K\textsubscript{2}O.

### 2. Material and Methods

The field experiment was carried out at College of Forestry Sam Higginbottom University of Agriculture, Technology & Sciences, Prayagraj U. P. India during Rabi season of 2018-19 experimental field is sandy clay loam. The maximum temperature in summer may reach up to 50° C and minimum temperature in winter may fall up to 6° C. The ten year old plantation of Poplar tree at 9x3 m spacing intercropped. The experiment was laid out in Randomized block design with 3 replications and 12 treatments. The organic manure FYM and Vermicompost. Linseed was shown on 05 Nov 2019 at a rows spacing of 30 cm. The full dose of N was added at the time of sowing to the crop. The sources of FYM and Vermicompost. Farmyard manure was applied @20 ton/ha to all the plots uniformly and was incorporated into the soil at the time of land preparation.

### 3. Results and Discussion

#### 3.1. Plant Height (cm)

At 30 DAS, The maximum plant the height was found in treatment T\textsubscript{11} FYM with 14.32 cm. The minimum plant height was found in treatment T\textsubscript{1}, VC with 7.48 cm. The result found was found significant. At 60 DAS, The maximum plant height was found in treatment T\textsubscript{11} FYM with 29.00 cm. The minimum plant height was found in treatment T\textsubscript{3} VC.
with 23.00 cm. The result obtained was found significant. At 90 DAS, The maximum plant height was found in treatment T8 FYM with 44.76 cm. The minimum plant height was found in treatment T3 VC with 38.04 cm. The result obtained was found significant. At 120 DAS, The maximum plant height was found in treatment T8 FYM with 58.41. The minimum plant height was found in treatment T8 VC with 54.22. The result obtained was found significant.

3.2. Plant Diameter (cm) at 120 DAS

At 30 DAS, The maximum Plant diameter was found in treatment T11 FYM with 0.82. The minimum Plant diameter was found in treatment T3 VC with 0.53. The result obtained was found significant. At 60 DAS, The maximum Plant diameter was found in treatment T11 FYM with 1.30. The minimum Plant diameter was found in treatment T3 VC with 1.08. The result obtained was found significant. At 90 DAS, The maximum Plant diameter was found in treatment T11 FYM with 2.94. The minimum Plant diameter was found in treatment T3 VC with 2.01. The result obtained was found significant. At 120 DAS, The maximum Plant diameter was found in treatment T11 FYM with 4.43. The minimum Plant diameter was found in treatment T3 VC with 3.33. The result obtained was found significant.

3.3. Capsule Per Plant

At 120 DAS, The maximum capsule per plant was found in treatment T1 FYM with 26.20. The minimum capsule per plant was found in treatment T1 VC with 13.40. The result obtained was found significant.

3.4. Seed Per Capsule

At 120 DAS, The maximum seed per capsule was found in treatment T1 FYM 9.33 The minimum seed per capsule was found in treatment T3 7.06 (VC 100% (Control) under Poplar based Agroforestry system respectively. The result obtained was found significant throughout the seed per capsule.

4. Conclusion

In view of the findings and results presented above, it is concluded that among all the nine different treatments, the treatment FYM had emerge the best on the growth parameter like plant height, Plant diameter, capsule per plant, seed per capsule. T1 FYM emerged best for the growth attributes of Linseed (Linum usitatissimum) and as well as for Poplar based to Agroforestry system. Trials in Utter Pradesh India, found that Linseed (Linum usitatissimum) could be grown successfully between lines of Poplar tree spaced 3.0 meters apart. The linseed (Linum usitatissimum) was planted in the dry season with limited irrigation, when there was no leaf cover from the Poplar. It was found that this system helped with weed control of the plantation and that the growth of intercropped Poplar was better, however science this is based on one-year experiment, further trails may be needed to substantiate the results.
